

Fork Positioner for Forklifts

Fork Positioner for Forklift - The fork positioner is a hydraulic apparatus which could allow the driver to operate the forklift without leaving the seat. They are made out of top quality materials and are meant to withstand the most difficult procedures and work environments. Side shifting models have the added ability to laterally position the arms or the entire load in order to facilitate more exact lifting and placement in a quicker and much more effective method.

The unique fork pocket design enables the individual operating it to be able to safely swing the unit's blades without any worry of destroying the positioning cylinders. This can allow the worker the alternative to either execute independent or simultaneous fork movement, depending on the job requirement. For most forklifts with non-OEM carriages, complete carriages are necessary. Standard OEM carriages can be transformed into blade positioners on available units.
